

Part 1

1. Using the MAX Function, write an SQL statement that shows the customer's last name closest to Z. Include an Aliases when appropriate.

```
SELECT MAX(LastName) AS ClosestToZ FROM CUSTOMER WHERE LastName < 'Z' ORDER BY MAX(LastName) DESC.
```

2. Using the SALE_ITEM Table, write an SQL statement that shows the SALEID and COMMISSION for each sale. Commission is a calculated field based on 10% of the (UnitPrice * Quantity). Order the results from highest to lowest commission and include an alias. (If your SALE_ITEM table does not have a quantity row then you need to

update your tables by going into the canvas files under Antique dataset, drop the tables and then add the new ones back!!)

```
SELECT SALEID, 0.1 * (UnitPrice * Quantity) AS COMMISSION FROM SALE_ITEM  
ORDER BY COMMISSION DESC;
```

The screenshot shows the Microsoft SQL Server Management Studio interface. The query editor contains the following SQL query:

```
SELECT  
    SALEID,  
    0.1 * (UnitPrice * Quantity) AS COMMISSION  
FROM  
    SALE_ITEM  
ORDER BY  
    COMMISSION DESC;
```

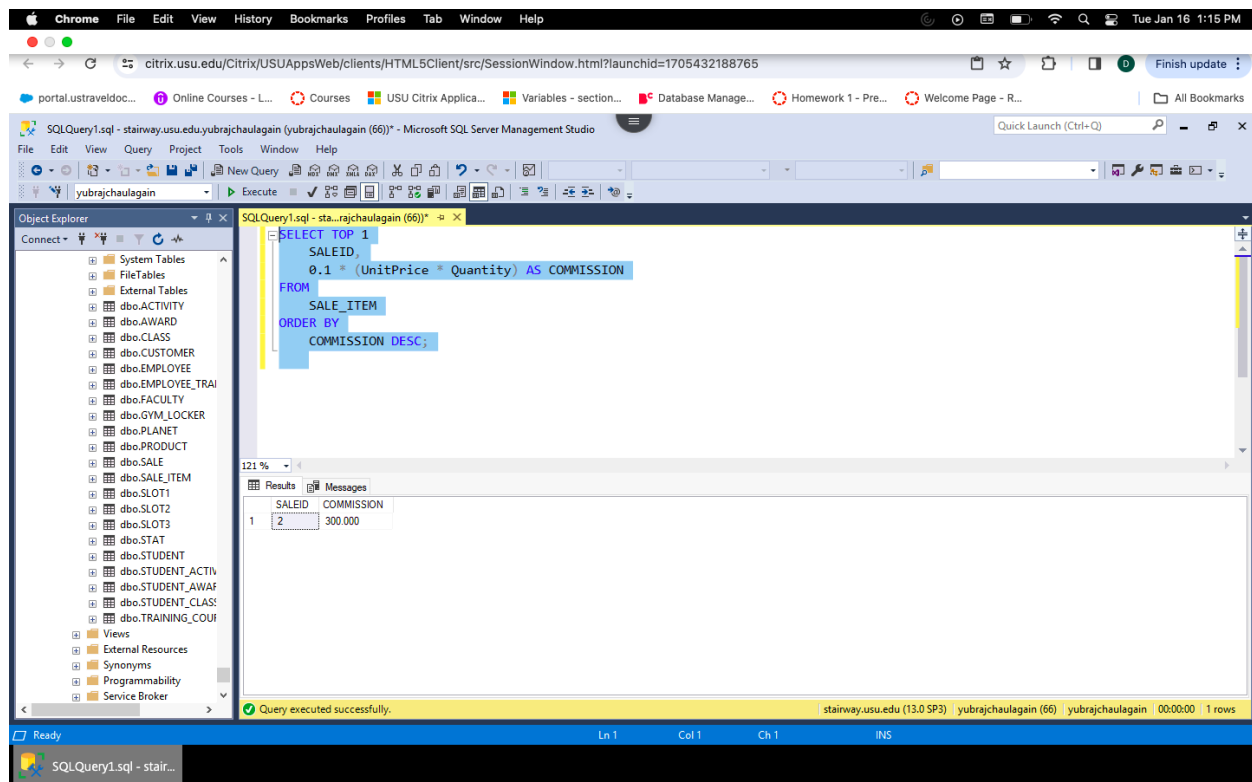

The query has been executed successfully, and the results are displayed in the Results pane. The results show 11 rows of data, sorted by Commission in descending order.

	SALEID	COMMISSION
1	2	300.000
2	12	300.000
3	9	240.000
4	14	160.000
5	1	150.000
6	3	150.000
7	4	150.000
8	6	130.000
9	7	100.000
10	8	90.000
11	15	70.000

The status bar at the bottom indicates that the query was executed successfully and returned 20 rows.

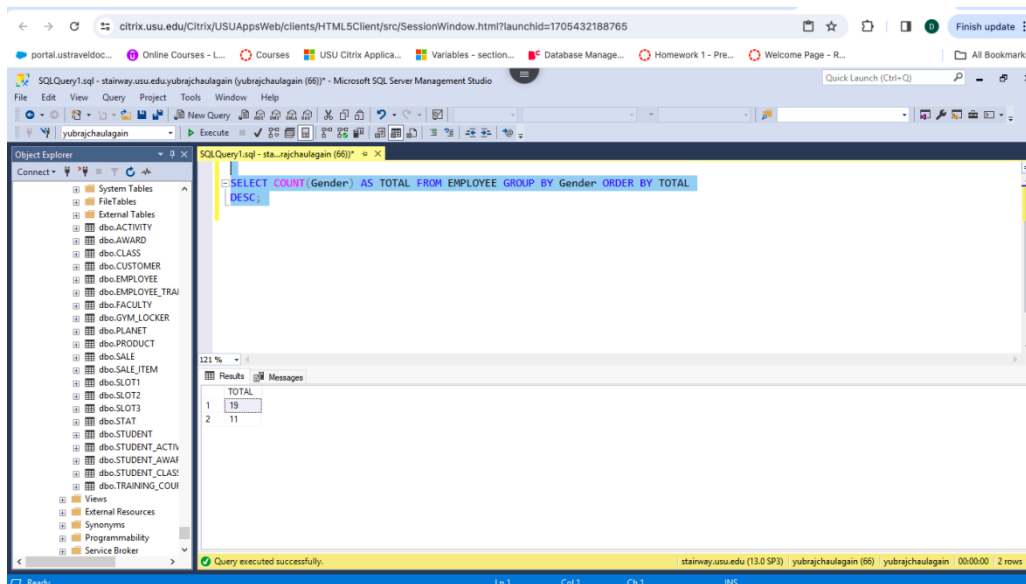

3. Modify the prior question to only show the highest SaleID and Commission using the TOP Function.

```
SELECT TOP 1 SALEID, 0.1 * (UnitPrice * Quantity) AS COMMISSION FROM  
SALE_ITEM ORDER BY COMMISSION
```

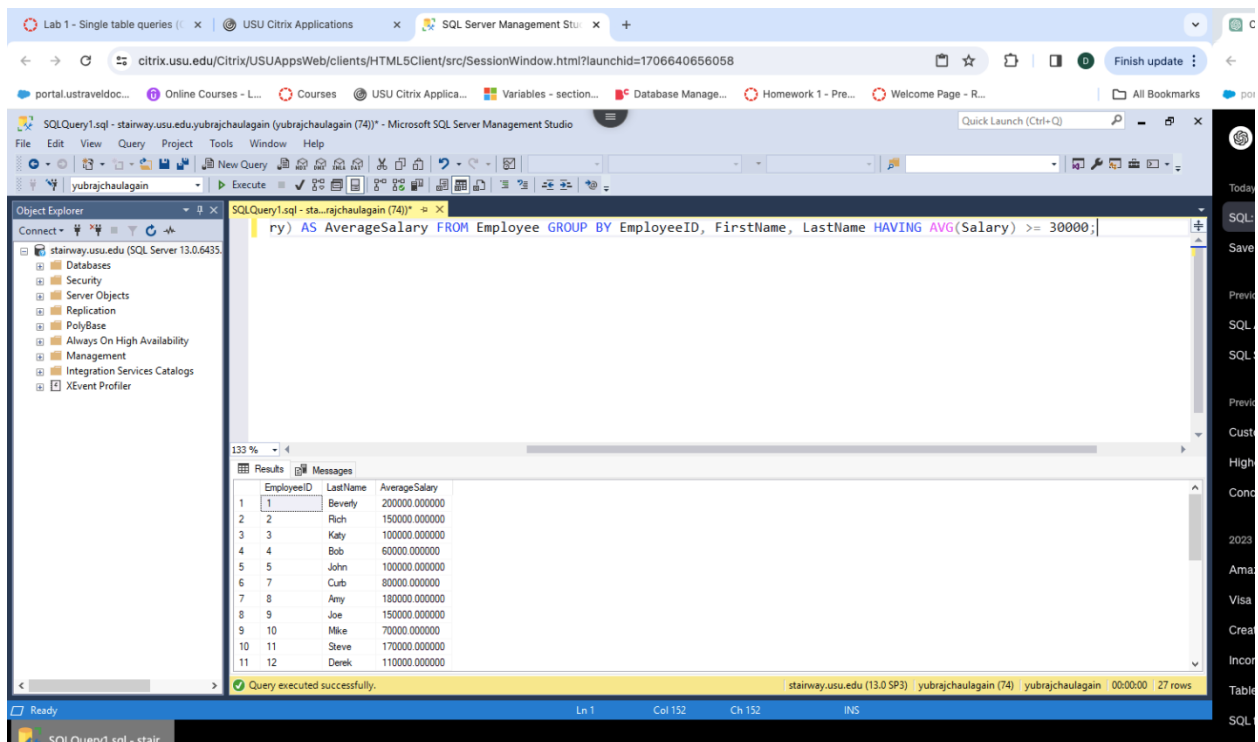

4. Write an SQL statement that shows Gender, and the total number of men and women that work for DPC Antiques. Order the output by the total from highest to lowest. Include an Aliases when appropriate.

```
SELECT COUNT(Gender) AS TOTAL FROM EMPLOYEE GROUP BY Gender ORDER BY TOTAL DESC;
```

5. Write an SQL statement that shows the average salary of each employee. Don't include salaries below 30000 in the calculation. Include an Aliases where appropriate. *Describe why this question doesn't need to be answered using the AVG(Salary) aggregate function.

SELECT EmployeeID, FirstName LastName, AVG(Salary) AS AverageSalary FROM Employee GROUP BY EmployeeID, FirstName, LastName HAVING AVG(Salary) >= 30000;

6. Write an SQL statement that shows the state and average salary of each state. Don't include salaries below 40000 in the calculation. Include an Aliases when appropriate. In addition, group the averages by State. Don't include groups with less than 2 employees.

SELECT State, AVG(Salary) As AvgSalary FROM EMPLOYEE WHERE Salary >= 40000 GROUP BY State HAVING COUNT(EmployeeID) >= 2;

The screenshot shows the SQL Server Enterprise Manager interface. The query window displays the following SQL statement:

```
SELECT State, AVG(Salary) As AvgSalary FROM EMPLOYEE WHERE Salary >= 40000 GROUP BY State HAVING COUNT(EmployeeID) >= 2;
```

The Results pane shows the following data:

State	AvgSalary
AZ	110000.000000
CA	110000.000000
CO	93333.333333
IL	86666.666666
LA	100000.000000
MD	93333.333333
PA	150000.000000
UT	60000.000000

7. Write an SQL statement that shows the Employees' maximum salary offered in each state. Don't include states (groups) with a maximum salary less than \$75,000.

SELECT State, MAX(Salary) FROM EMPLOYEE WHERE Salary >= 75000 GROUP BY State HAVING MAX(Salary) >= 75000;

The screenshot shows the SQL Server Enterprise Manager interface. The query window displays the following SQL statement:

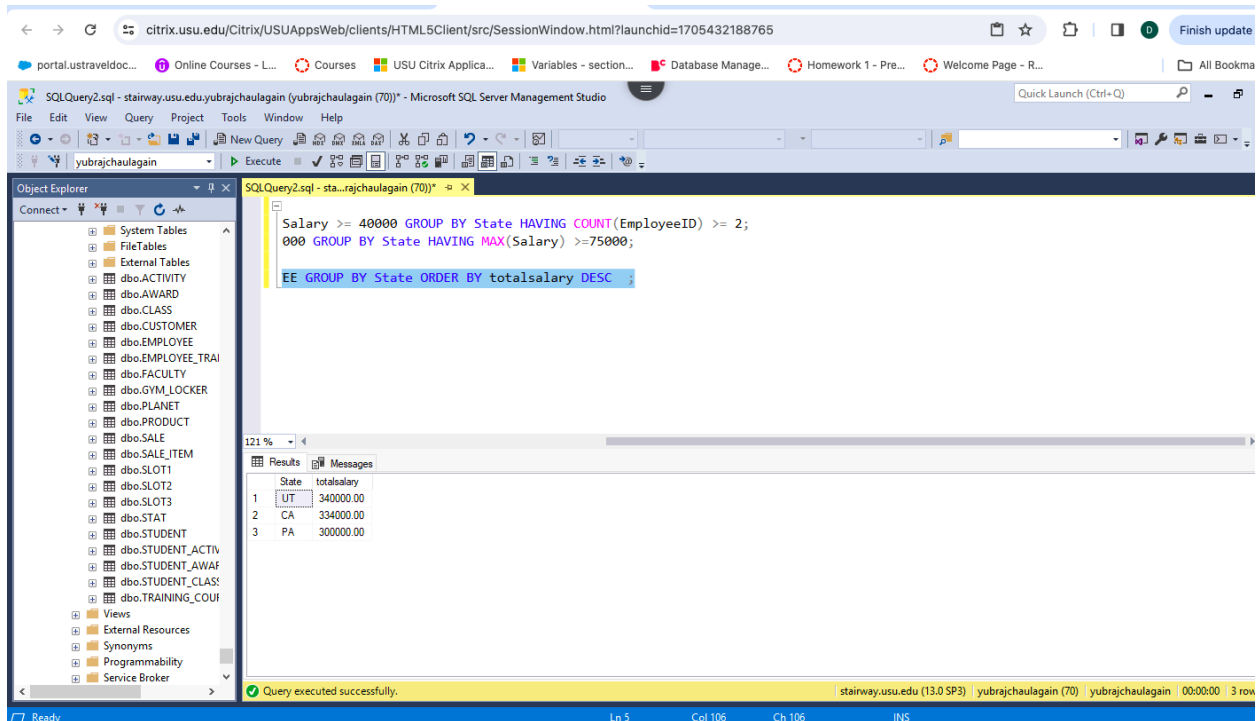

```
SELECT State, MAX(Salary) FROM EMPLOYEE WHERE Salary >= 75000 GROUP BY State HAVING MAX(Salary) >= 75000;
```

The Results pane shows the following data:

State	(No column name)
AZ	170000.00
CA	150000.00
CO	120000.00
HI	180000.00
IL	150000.00
LA	110000.00
MD	130000.00
MT	200000.00
PA	160000.00
TX	150000.00
UT	110000.00

8. Using a GROUP BY Clause, write an SQL statement that shows the TOP 3 hometowns of Employees based on total salaries being paid. Use the TOP and ORDER BY Clause to solve.

SELECT TOP 3 State, SUM(Salary) as totalsalary FROM EMPLOYEE GROUP BY State ORDER BY totalsalary DESC;

The screenshot shows the Microsoft SQL Server Enterprise Manager interface. The Object Explorer on the left displays the database structure for 'yubrajchaulagain'. The central query window shows the following SQL statement:

```
Salary >= 40000 GROUP BY State HAVING COUNT(EmployeeID) >= 2;  
000 GROUP BY State HAVING MAX(Salary) >= 75000;  
EE GROUP BY State ORDER BY totalsalary DESC ;
```

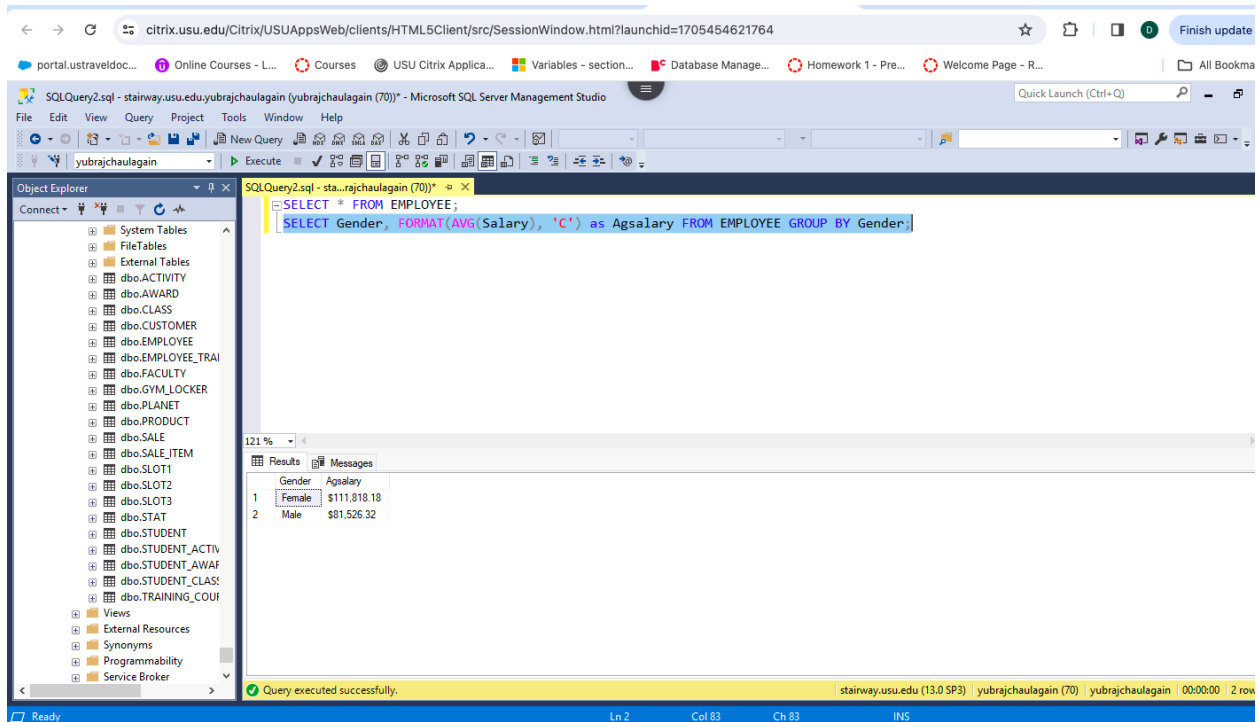

The Results pane at the bottom displays the output of the query, showing the top 3 states by total salary:

State	totalsalary
UT	340000.00
CA	334000.00
PA	300000.00

The status bar at the bottom indicates the query was executed successfully.

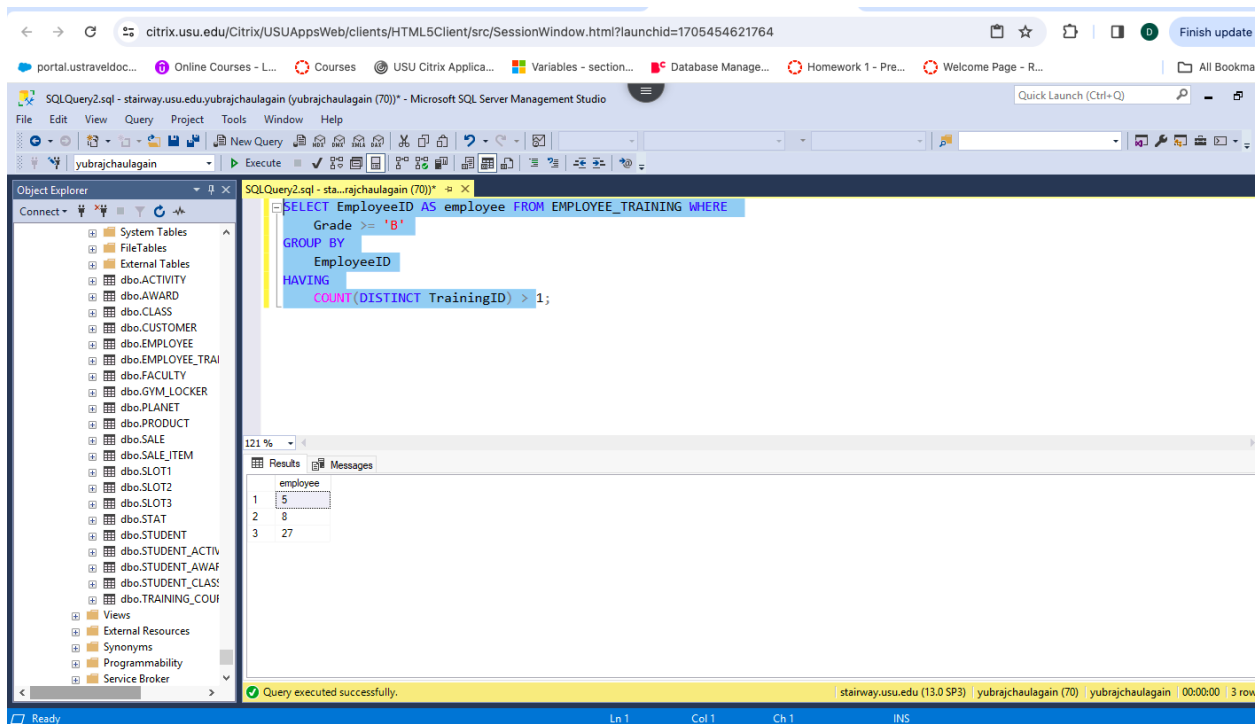

9. Write an SQL statement that illustrates whether men or women employees have higher average salaries. Format the average salary column to 'currency' (i.e, \$34.55).

SELECT Gender, FORMAT(AVG(Salary), 'C') as Agsalary FROM EMPLOYEE GROUP BY Gender;

10. Write an SQL statement that shows employee IDs that have completed more than one class with a grade of B or better. Include an Aliases when appropriate. *This is a unique question where you might include a HAVING Clause to treat each employee as a group.

SELECT EmployeeID AS employee FROM EMPLOYEE_TRAINING WHERE Grade >= 'B' GROUP BY EmployeeID HAVING COUNT(DISTINCT TrainingID) > 1;

11. Write an SQL statement that shows each Grade and the latest date where someone was assigned a grade using MAX(Completion Date) code in the SELECT statement of solution.

SELECT Grade, MAX(CompletionDate) AS LatestAssignmentDate FROM
EMPLOYEE_TRAINING GROUP BY Grade;

Part 2

1. Curb uses the Employee data for corporate presentations. He would like his data output to show the full spelling for state information rather than abbreviations. The database administrator is unwilling to accommodate this request. Help Curb by creating a view called vSTATE that contains the full name of the employee along with the full spelling of the state using a CASE EXPRESSION. Just include the states that are included in the Employee Table.

```
CREATE VIEW vSTATE AS

SELECT  EmployeeID, FirstName, LastName,

        CASE State

            WHEN 'IL' THEN 'Illinois'

            WHEN 'NV' THEN 'Nevada'

            WHEN 'TX' THEN 'Texas'

            WHEN 'MD' THEN 'MaryLand'

            WHEN 'PA' THEN 'Pennsylvania'

            WHEN 'UT' THEN 'Utah'

        ELSE State

        END AS FullState

FROM
```

Employee;

2. For internal use, the antique store would like to create a view that provides additional information regarding product quality. In the current product database, if the quality is 1, the actual quality is Very Good. If the quality is 2, the actual quality is About Uncirculated. Finally, if the quality is 3, the actual quality is Mint State. Write an SQL view called vQuality that creates a new virtual column that includes actual quality descriptions. Show the ProductID, ProductName, and New Column.

3. Write a searched CASE Expression using the PRODUCT table that provides a new column that displays 'High Quality' if qualityID is > 1 and 'Not Sure' for any other possibilities (ELSE statement). Show the ProductName and New column.

```
SELECT ProductName, CASE
```

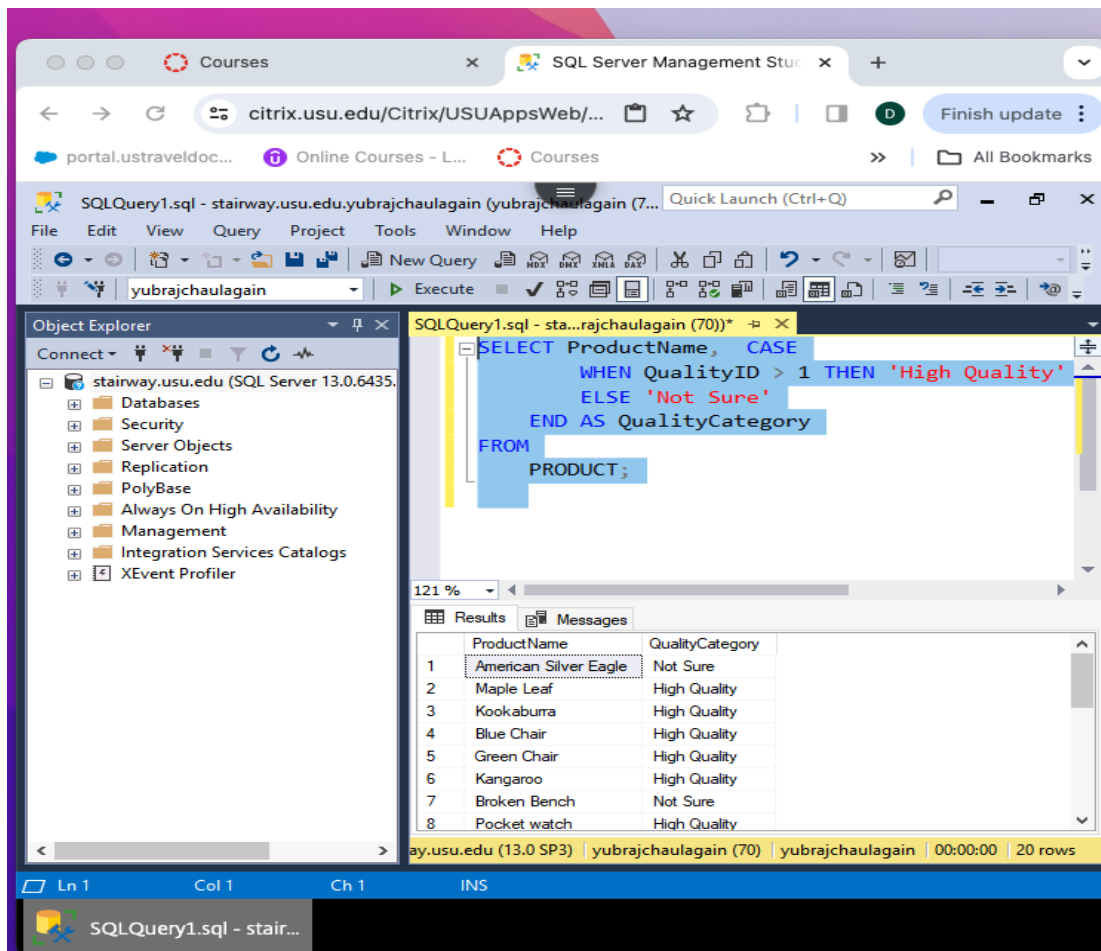

```
    WHEN QualityID > 1 THEN 'High Quality'
```

```
    ELSE 'Not Sure'
```

```
END AS QualityCategory
```

```
FROM
```

PRODUCT;

4. Write your own SQL coding question and answer that requires a case expression. Indicate if the CASE Expression is Simple or Searched.

Question:

Consider a table named employees with columns employee_id, salary,

Write an SQL query to create a new column named

total_compensation based on the following conditions:

- If the employee's salary is less than 50000, add a bonus of 10%.

- If the employee's salary is between 50000 and 80000 (inclusive), add a bonus of 8%.
- If the employee's salary is greater than 80000, add a bonus of 5%.

SELECT

EmployeeID,

salary,

CASE

WHEN salary < 50000 THEN salary + (salary * 0.10)

WHEN salary BETWEEN 50000 AND 80000 THEN salary + (salary * 0.08)

WHEN salary > 80000 THEN salary + (salary * 0.05)

END AS total_compensation

FROM

EMPLOYEE;

The screenshot shows the Microsoft SQL Server Management Studio interface. The query editor contains the following SQL code:

```

CASE
    WHEN salary < 50000 THEN salary + (salary * 0.10)
    WHEN salary BETWEEN 50000 AND 80000 THEN salary + (salary * 0.08)
    WHEN salary > 80000 THEN salary + (salary * 0.05)
END AS total_compensation
FROM
    EMPLOYEE;

```

The Results pane shows the output of the query, which is a table with three columns: EmployeeID, salary, and total_compensation. The data is as follows:

EmployeeID	salary	total_compensation
1	200000.00	210000.0000
2	150000.00	157500.0000
3	100000.00	105000.0000
4	60000.00	64800.0000
5	100000.00	105000.0000
6	4000.00	4400.0000
7	80000.00	86400.0000
8	180000.00	189000.0000
9	150000.00	157500.0000
10	70000.00	75600.0000
11	170000.00	178500.0000

The status bar at the bottom indicates "Query executed successfully." and "30 rows".

Consider a hypothetical EMPLOYEE table with columns EmployeeID, FirstName, LastName, and YearsOfService. Write an SQL query that creates a new column called ServiceCategory using a CASE expression. If an employee has worked for the company for more than 5 years, categorize them as 'Long-Term'; if between 2 and 5 years, categorize them as 'Mid-Term'; otherwise, categorize them as 'Short-Term'.

SELECT

EmployeeID,

FirstName,

LastName,

YearsOfService,

CASE

WHEN YearsOfService > 5 THEN 'Long-Term'

WHEN YearsOfService BETWEEN 2 AND 5 THEN 'Mid-Term'

ELSE 'Short-Term'

END AS ServiceCategory

FROM

EMPLOYEE;

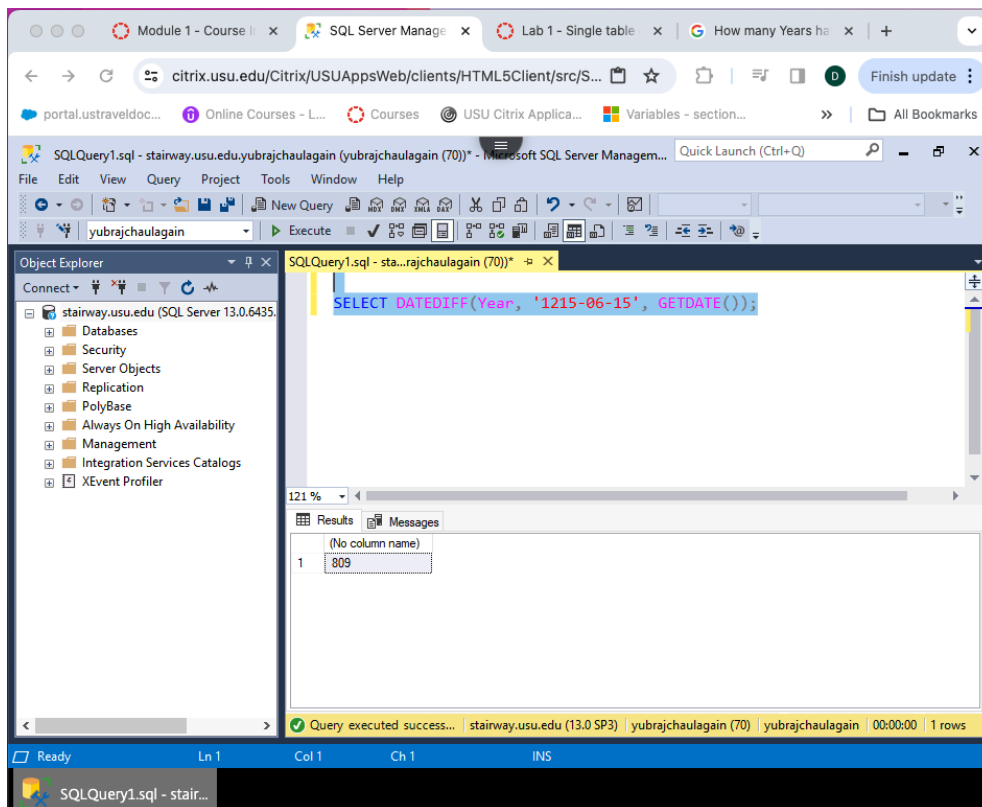

The CASE expression categorizes the years of service into different categories based on the specified conditions.

It is a Searched CASE Expression because it evaluates multiple conditions.

The result includes the original columns (EmployeeID, FirstName, LastName, YearsOfService) and a new column ServiceCategory

5. How many Years have passed since the Magna Carta was signed? Don't hardwire today's date. Use an Aliases when appropriate.

SELECT DATEDIFF(Year, '1215-06-15', GETDATE());

6. How many days has it been since Huntsman Hall opened at Utah State and Wharton Business School. For Wharton, you can include the year and make up the month and day? The output should include two columns and include aliases.

SELECT

'Huntsman Hall' AS Building,

DATEDIFF(DAY, '2017-03-16', GETDATE()) AS DaysSinceOpening

UNION

SELECT

'Wharton Business School' AS Building,

DATEDIFF(DAY, '1888-09-23', GETDATE())

X
